

## TASK (Tovek Analytical deSktop Kit) solution

### Characteristics of the TASK solution

TASK is a high-performance desktop solution for professional users – analysts who need to obtain, analyse and evaluate information from internal and external sources in order to fulfil their work duties. This is a modular solution that can be configured according to the user's specific requirements.

### Schematic of the TASK solution

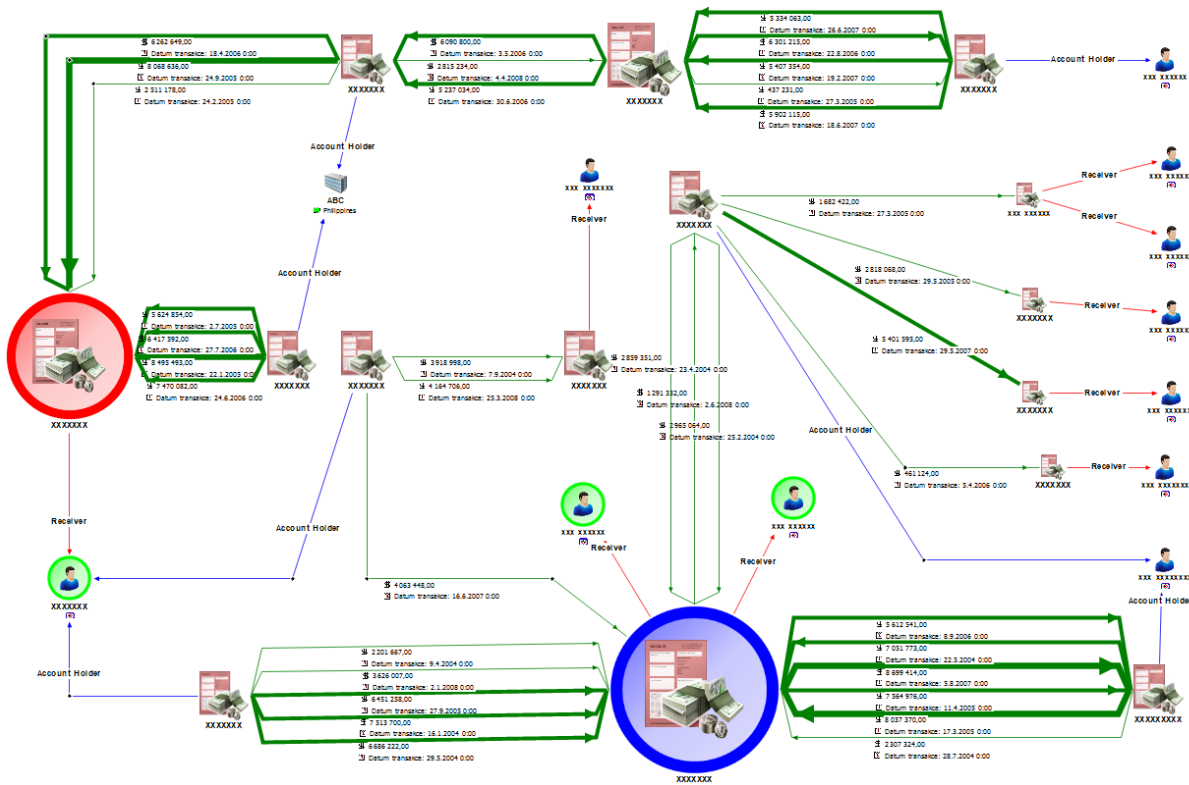

The basis of the TASK solution is a powerful **analytical module** that makes it possible to rapidly and precisely mine hidden information, connections and trends from large volumes of primary data. It offers a number of advanced analytical functions focused on, among other things, analysis of subjects' activities, social network, flow of commodities, financial transactions and telephone calls. A full range of visualisation possibilities is available for relational, time, spatial, statistical or tabular display of analysis results.

The analytical module is **connected to information sources** that can be both **internal** (for example, intra-company systems) and **external** (commercially available databases). Direct connection saves time needed for collecting data and, thanks to the advanced functionalities for effective inquiry and search, increases the speed and precision of analyses.

The **knowledge base** connected with the analytical module enables storage of processed analyses and results for further use. The stored findings can be shared within working teams and used as know-how for future analyses.

The **terminology manager** serves for managing the terminology used in analytical outputs when working with the analytical module. For example, it can be used for translating data from foreign-language sources, for ensuring conformity of terminology with internal or sectoral standards.

As part of the TASK solution, we provide necessary **consulting**, especially with respect to selecting the appropriate information sources. We also ensure the provision of thorough **training** for future users. For deployment of the TASK solution in a specific area, we will prepare and provide a specific **methodology** that will be based on our extensive experience and will ensure maximum utilisation of the entire solution.

## Usage

The TASK solution has a broad range of usage possibilities, primarily in the areas of prevention, detection and investigation of various types of fraudulent and criminal activities and security incidents. It is used both in the commercial sphere (insurance fraud, credit risks, cyber attacks, etc.) and in the area of state administration (common crime, organised crime and financial offences, among others).

## Notice

*The solution is licensed as a complete unit; it is not possible to use individual components separately. Provision of data sources is not a standard part of the solution.*
